APPENDICES

APPENDIX A First Quarter-2004 Groundwater Analytical Data

THIS PAGE INTENTIONALLY LEFT BLANK.

EXECUTIVE SUMMARY

This Quarterly RFCA Groundwater Monitoring Report presents water quality data resulting from groundwater monitoring at RFETS during the first calendar quarter of 2004 (1Q2004). Groundwater monitoring and data reporting are required by RFCA, and defined by the FY 2004 Integrated Monitoring Plan (DOE, 2003a and 2003b). Further details describing the groundwater monitoring program and its reporting requirements, are found in the Integrated Monitoring Plan Background Document (DOE, 2003b).

Groundwater monitoring at RFETS during 1Q2004 attempted to sample groundwater at 23 locations, down from 169 locations last quarter. Most IMP sampling is performed during the second quarter and during the fourth quarter. The locations visited during 1Q2004 included 21 IMP and 2 non-IMP sampling sites. Of these, full or partial suites of samples were collected from 13 locations (excluding treatment systems), while 5 locations were completely dry. Therefore, not all of the requested analytical data could be collected during the quarter. Overall, sample collection success for the quarter was 73%.

The overall size of the dataset for 1Q2004 was 2,563 analytical records (including laboratory QA/QC). This is down from the 16,692 records collected last quarter. The reason for the low record count during 1Q2004 is that the monitoring program only sampled RCRA wells, wells on monthly sampling schedules, or Non-IMP locations during the first quarter.

During 1Q2004 groundwater monitoring, 4 concentrations were observed to be greater than corresponding Tier I action levels for 2 different analytes (uranium isotopes). During the quarter there were no reportable Tier I results.

In 1Q2004, there were 34 analyte concentrations in groundwater that were greater than Tier II action levels. Groundwater from RCRA wells accounted for 16 of these events. The frequencies of concentrations above Tier II in other well groups include: Plume Extent (8), Plume Definition (6), and Performance Monitoring (4).

Chemicals with the highest frequency of activities or concentrations greater than Tier II include: U-233,234 (5 events), U-235 (5), U-238 (4), selenium (4), and nitrate/nitrite (4 events).

There were 16 reportable Tier II results, not including the Tier I results mentioned earlier. Groundwater from RCRA wells contained the largest number (11) of reportable concentrations above Tier II. Water from Plume Extent wells contained 5 reportable Tier II events.

A data quality assessment (DQA) of the 1Q2004 water quality data concluded that the overall data set is generally of high quality in terms of analytical precision, accuracy, representativeness, completeness, and comparability. However, there were a few issues as described below.

The metals suite missed the accuracy goal with 79% acceptable recoveries. The goal is 90%. Overall, across all analytical suites (metals, VOCs, and water quality parameters), the percentage of acceptable MS/MSD results was 86%, missing the accuracy goal of 90%.

ACRONYMS & TERMS

ALF	RFCA Action Level Framework
Analyte	Any chemical or radionuclide whose concentration or activity in a groundwater sample is analyzed by an analytical laboratory.
ASD	Kaiser-Hill Analytical Services Division. This group establishes procedures and contracts that govern the analysis of groundwater samples collected at RFETS, and the subsequent verification and validation of the analytical data. ASD is also responsible for entering the data into SWD.
Background M2SD	Background mean <u>plus</u> two standard deviations. These values are calculated on a site-wide basis for naturally occurring analytes.
BOA	Basic Ordering Agreement for analytical laboratory services.
CAS	Chemical Abstracts Service assigns a unique number to identify analytes that may have multiple chemical names. The registry number is called a "CAS Number".
CDPHE	Colorado Department of Public Health and Environment.
CLP	Contract Laboratory Program (or Procedures) developed by EPA.
CRDL	Contract Required Detection Limit. A synonym for RDL.
CT	Carbon tetrachloride.
D&D	Decontamination and Decommissioning
DCE	One of several dichloroethenes, typically cis-1,2-dichloroethene.
DER	Duplicate Error Ratio calculated for real/duplicate radionuclide analyses.
DOE	United States Department of Energy
DQA	Data Quality Assessment as used in this report focuses on evaluations of the PARCC parameters.
DUP	DUP is a SWD code identifying data describing "field duplicate samples". In this report, DUP refers to data describing a duplicate groundwater sample collected in the field and associated with a REAL sample.

EPA	United States Environmental Protection Agency
Historic M2SD	Historic mean plus 2 standard deviations. Each value is calculated from historical analytical data for a specific analyte in a specific well.
IHSS	Individual Hazardous Substance Site
IMP	RFETS Integrated Monitoring Plan, which describes in general terms the components and objectives of the groundwater monitoring program, and how groundwater data will be collected, evaluated and reported. The IMP is updated yearly and contains the list of wells in the monitoring program. The IMP also specifies the chemical suites that groundwater samples will be analyzed for.
IMPBD	The RFETS IMP Background Document, which describes specifics of the groundwater monitoring program, and describes the well classes and how groundwater quality data will be collected, interpreted, and reported in compliance with RFCA.
K-H	Kaiser-Hill, LLC
LCS	Laboratory Control Sample. A type of QC sample, which originates in the analytical laboratory.
LC1, LC2	SWD identifies LCS samples with numbered codes, e.g. LC1.
LIC	Line-item-code (LIC) is assigned by ASD to identify specified analyte suites, analytical methods, and required detection limits.
MCL	Maximum Contaminant Level
ug/L	Microgram per liter.
mg/L	Milligram per liter.
MS	Matrix Spike, a QC sample.
MSD	Matrix Spike Duplicate sample. MS/MSD sample data may be used to determine both precision and analytical accuracy.
PARCC	Precision, Accuracy, Representativeness, Comparability and Completeness
PCB	polychlorinated biphenyl
PCE	tetrachloroethene

pCi/L	picoCurie per liter.
PQL	Practical Quantitation Limit is a type of analytical detection limit. The PQL is the lowest concentration for which the 95% confidence interval brackets the true concentration within 20%.
QAPP	Quality Assurance Program Plan
QC	Quality Control, as in a QC sample generated for quality control purposes.
RCRA	Resource Conservation and Recovery Act
RDL	A Required Detection Limit specified by ASD. A synonym of CRDL.
REAL	REAL is a SWD code identifying "primary" or "real" samples, as opposed to QC samples. In this report, REAL refers to data describing the primary groundwater sample collected at a well or building drain during a sampling event.
RFCA	Rocky Flats Cleanup Agreement
RFETS	Rocky Flats Environmental Technology Site
RIN	An identifying number assigned to a set of environmental samples by ASD.
Rinsate	A QC sample generated by pouring clean deionized water over or through sampling equipment, which has previously been decontaminated. Analysis of rinsate samples (RNS) may indicate cross-contamination due to incomplete or improper decontamination procedures.
RNS	A SWD code identifying data describing a rinsate sample.
RPD	Relative Percent Difference in measured concentrations between a groundwater sample and a duplicate groundwater sample collected in the field. RPDs are a measure of precision applied to non-radionuclide data.
SEP	The former Solar Evaporation Ponds, 207C, 207A, 207B north, central and south.
SOP	Standard Operating Procedure
SOW	Statement of Work
SUR	A SWD code indicating analytical data for surrogate compounds.
Surrogate Compound	Any of a set of distinctive compounds that do not occur in nature and are not normally found in environmental samples. Analytical procedures for VOA and

SVOA analysis often require one or more surrogates to be spiked into samples prior to their analysis, as a quality control check. SUR data are reported by the laboratory, and may be used in data validation.

SVOA	Semivolatile organic analyte.
SVOC	Semivolatile organic compound, a synonym for SVOA.
SWD	RFETS Soil Water Database maintained by ASD.
TCE	Trichloroethene
TDS	Total Dissolved Solids
Tier I	Analyte-specific action level originally defined by RFCA, updated by IMP
Tier II	10^{-2} of Tier I
TPU	Total Propagated Error
TRPH	Total Recoverable Petroleum Hydrocarbons
TSS	Total Suspended Solidss
VOA	Volatile Organic Analyte
VOC	Volatile Organic Compound, a synonym for VOA.
V&V	Validation and Verification of environmental quality data
Well Class	Monitoring wells at RFETS are classified into one or more of 8 well classes, which relate to groundwater monitoring objectives. For example, the Boundary Monitoring well class refers to wells used to monitor groundwater quality leaving the eastern RFETS boundary.
>=	Value on the left is greater than or equal to the value that follows the >= symbol
<=	Value on the left is less than or equal to the value that follows the <= symbol
>	Value on the left is greater than the value to the right of the > symbol.
<	Value on the left is less than the value to the right of the < symbol.

1 INTRODUCTION

The DOE, K-H, URS team has completed review of first calendar quarter 2004 (1Q2004) groundwater analytical data using groundwater action level criteria as described in RFCA Attachment 5 (K-H, 2000). This report is required by Section 3.4.B of Attachment 5 of the Final Rocky Flats Cleanup Agreement (RFCA) (EPA, CDPHE, DOE, 1996), and is described in the FY 2004 Integrated Monitoring Plan (IMP) (DOE, 2003a and 2003b). Groundwater sampling for 1Q2004 reflects the approval of the monitoring well list (CDPHE, Nov. 1996 and EPA, Nov. 1996), and the establishment in the IMP of semi-annual sampling frequencies for most well classes. Only RCRA monitoring wells are routinely sampled and reported each quarter. A portion of the wells will be sampled within a given quarter; the remaining wells are sampled in the following quarter as site conditions allow.

The report is organized into six sections. Section 1, Introduction, discusses changes made since the preceding report. Section 2 summarizes the methodology used to produce the report and defines the well classes. Water quality results for individual wells and Tier I and Tier II reportable occurrences are presented in Section 3. Maps and selected time-series plots are found at the end of Section 3. Required actions based on the current findings, and completed actions from previous quarterly reports are discussed in Section 4. A data quality assessment is presented in Section 5. References are in Section 6. Appendix A is a tabulation of groundwater quality data for the quarter.

Throughout the report, emphasis is placed on features that are different or noteworthy in comparison to previous quarterly monitoring reports. No summary or conclusions section is provided because the Quarterly RFCA Groundwater Monitoring Report is intended to be a data transmittal, rather than an interpretive report. Except for comparisons of groundwater data against action levels and a data quality assessment, geochemical and hydrologic interpretations are deferred to the 2004 Annual RFCA Groundwater Monitoring Report.

Twenty three (23) groundwater monitoring locations were visited for sampling in accordance with the IMP during 1Q2004, and are listed in Table 3-1 and Table 3-2. Twenty one of these were IMP monitoring locations, while 2 were sampled to meet non-IMP objectives. Non-IMP monitoring takes place at RFETS to meet various objectives, such as well abandonment or other special sampling. All groundwater sampling locations are shown on Figures 3-1 and 3-2 along with site features and the nitrate and composite VOC plume boundaries. The plume boundaries shown on these figures are from the 2001 Annual RFCA Groundwater Monitoring Report (K-H, 2002).

Excepting treatment system influent and effluent, all Water Monitoring and Compliance Program (WMCP) data available in SWD for the calendar quarter are included in the quarterly report irrespective of IMP-well class. In keeping with prior reports, building sump/drain locations, and drains associated with the Present Landfill may also be included in this report with monitoring well data. Sampling for

performance monitoring of groundwater treatment systems is addressed in a separate report that is issued annually.

The IMP Background Document states that downgradient RCRA wells will be reported quarterly in the same manner as Drainage Wells. Starting with the third quarter 2002 report, all RCRA wells (upgradient or downgradient) have been compared against action levels, and treated under the same rules as applied to Drainage Wells. This change has been made because some RCRA wells upgradient of the Present Landfill may be influenced by the nearby VOC plume that originates in the PU& D Yard.

In addition to monitoring wells cited in this report, a number of other water sampling locations are included: BS-865-2, 891COLWEL, SW13494, FD-559-561, FD-707-4, FD-774-1, FD-774-4, B371BAS, B371SUBBAS, SW085, SW099, and SW100. BS-865-2 is a footing drain outside Door #1 of Building 865. 891COLWEL is a pump-equipped collection well that collects water from the 881 Hillside above the former French Drain. Location SW13494 is a sump for the footing drain system of Building 881 and is located on the 881 Hillside. The "FD" locations are footing drains associated with buildings: B559, B707, and B774. B371BAS and B371SUBBAS are footing drains collecting groundwater from Buildings 371 and 374. SW085 is an outfall for Building 779, and is a non-IMP water sampling location. Sampling stations SW099 and SW100 are collection boxes associated with the groundwater intercept system for the Present Sanitary Landfill.

2 METHODS

Groundwater quality data (analytical data) generated by RFETS during first quarter 2004, were classified and evaluated as described below.

2.1 Data Processing

Data evaluated in this report were retrieved from the Soil and Water Database (SWD) and processed as follows:

- RFETS Groundwater analytical results for the quarter were uploaded from SWD into a local database. This local database and the queries used to process the data are archived on the Water Programs server.
- Database queries were written to examine the data and to identify potential problems such as incorrect concentration units, or concentration unit mismatches between the groundwater quality data and the action level tables to which these data were compared against.
- The dataset was examined for the potential presence of sample locations that are not relevant to the WMCP, such as tanks, treatment system influent and effluent, and most surface water stations. Data records outside the date range of the quarter, or pertaining to irrelevant locations are removed from the working dataset.
- Field and laboratory QC data were split into a set of separate data tables for more convenient use in the data quality assessment (DQA) presented in Section 5. Queries were also written to create and export suitable Excel tables for the written report.
- The DQA follows requirements set forth in the Quality Assurance Program Plan For The Groundwater Monitoring Program, Rocky Flats Environmental Technology Site (RMRS, 2001).
- The concentrations or activities of analytes in primary (REAL) and field duplicate (DUP) groundwater samples were screened against RFCA Tier I and Tier II action level framework (ALF) criteria, with the following exceptions.
 1. Non-detect results (with a "U" result qualifier, or UJ validation qualifier).
 2. Results rejected in validation or verification ("R" or "R1" qualified).

3. Surrogate compounds added by the laboratory for analytical quality control.

- Note that the RFCA action level framework states that if the practical quantitation limit (PQL) of an analyte is higher (less stringent) than the action level, then the PQL is used as the compliance threshold (CDPHE, DOE, and EPA, 5/28/03, Final RFCA Attachment 5, p. 5-30). Therefore, this quarterly report actually compares the detected activities or concentrations against the higher of either the PQL or the groundwater action level.
- Results from Boundary, Drainage, Plume Definition, Plume Extent, and RCRA wells were classified as reportable or non-reportable. Methods for making these determinations are defined below. Criteria for the determinations are also found in the later discussion of IMP Well Classes.
- Plume Degradation and RCRA monitoring data are evaluated in the Annual Groundwater Monitoring Report. Performance monitoring wells, although screened against the action level criteria, are not subject to the reportable/non-reportable classification.
- Analytical baseline values for Decontamination and Decommissioning (D&D) wells have not been determined at this time (except for Building 886 D&D wells).
- Calculated ratios of the analyzed concentrations or activities, divided by the Tier II action levels, PQLs, background M2SDs, or by the historic M2SDs, are used to identify IMP reportable results. Reportable results are defined in Section 2.2, IMP Well Class descriptions. Note that "M2SD" indicates that two sample standard deviations have been added to the background mean or to a historic mean concentration.
- Well-specific historic M2SDs have previously been calculated for individual analytes in groundwater from wells with five or more sampling events during the years 1991 to 1995. However, this methodology prevents the calculation of baseline M2SDs for wells installed since about 1994. RFETS plans to re-compute the historic M2SDs for all analytes in all wells for which at least 5 data points are available more recently than January 1, 1991. Data for the first 5 sampling events for each analyte in each well will be used to compute the M2SDs.
- If no historic M2SD is available for an analyte in a well, an evaluation of the concentration of the analyte over time may be made by visual inspection of the associated trend plot if sufficient data are available.
- Background values have been established for most metals, radionuclides, and water quality Parameters. Therefore, when ALF values have been exceeded, the analytical data are compared with the Site-wide background M2SD and with the historic M2SD values. Note that the historic

M2SD values are well- and analyte-specific, in contrast to the background M2SDs, which are analyte-specific for groundwater from the Upper Hydrostratigraphic Unit (UHSU).

- Background M2SD values for metals, water quality parameters, americium-241, plutonium-239/240, uranium-233/234, uranium-235, and uranium-238, tritium, and strontium-89/90 have been taken from the RFETS Background Geochemical Characterization Report (EG&G, 1993). A background value for neptunium-237 has not been determined.
- Manmade volatile organic compounds (VOCs) and polychlorinated biphenyls have no background concentrations at RFETS, they are simply compared to available historic M2SDs.

2.2 IMP Well Class Definitions

The RFETS groundwater monitoring network, as defined in the FY 2004 IMP (DOE, 2003a and 2003b), contains eight categories of monitoring wells. The IMP and IMPBD establish decision rules for determining Tier I and Tier II reportable results for groundwater sampled from these wells and analyzed for potential contamination. The well types and decision rules for data reporting are defined below:

2.2.1 Plume Definition Monitoring Wells

Plume Definition wells (well class "PD" in tables within this report) are located within known contaminant plumes and contain one or more groundwater analyte concentrations that are greater than Tier II action levels. However, many of these groundwater concentrations are below the Tier I action levels established in the ALF.

A reportable result occurs when the measured concentration exceeds a Tier I action level, and exceeds the background M2SD, and exceeds a historic M2SD. To be conservative, this quarterly report considers the result reportable if Tier I is exceeded in the absence of both background M2SD and historic M2SD. In the absence of only one of the M2SDs, the result is reportable if Tier I is exceeded and the available M2SD is also exceeded. If the result is reportable, the required action is to reclassify the well as a "Tier I reportable result well". Whether reportable events, or not, all constituents that exceed Tier I are tabulated in the Quarterly RFCA Groundwater Monitoring Report.

If a well becomes a Tier I reportable result well, the next Annual RFCA Groundwater Monitoring Report will review historic data for the well to determine if the well should be prioritized for further evaluation or remediation based on potential impacts to surface water. If the data show an increasing concentration trend over a two-year period, or the well has not been previously prioritized for evaluation, then the annual report will show the updated priority of the well for evaluation or remediation.

2.2.2 Plume Extent Monitoring Wells

Plume Extent wells are located at the edges of known groundwater-contaminant plumes, along pathways to surface water. These wells monitor for an increase in concentrations that may result in future impacts to surface water. A reportable result occurs if the measured concentration exceeds the Tier II action level and the background M2SD value. If there have not been historic reportable results, or the recent concentration exceeds the historic M2SD concentration in the well, the required action is to initiate monthly sampling. Under monthly sampling, if action levels are exceeded during three consecutive months, then stakeholders are notified via a subsequent Quarterly RFCA Groundwater Monitoring Report, and the possible impacts to surface water are evaluated in the Annual RFCA Groundwater Monitoring Report. Plume Extent wells are identified by the well class letters "PE" in tables in this report.

2.2.3 Drainage Monitoring Wells

These wells are located in stream drainages downgradient of contaminant plumes. They have the same programmatic requirements under the IMP as Plume Extent wells. A reportable result occurs if a measured concentration exceeds a Tier II action level and the background M2SD value. If there have not been historic reportable results, or the recent concentration exceeds the historic M2SD concentration in the well, the required action is to initiate monthly sampling. Under monthly sampling, if action levels are exceeded for three consecutive months, then stakeholders are notified via a subsequent Quarterly RFCA Groundwater Monitoring Report, and the possible impacts to surface water are evaluated in the Annual RFCA Groundwater Monitoring Report. Drainage wells are identified by the well class letter "D" in tables in this report.

2.2.4 Boundary Monitoring Wells

These wells monitor groundwater leaving the eastern Site boundary through the alluvial deposits beneath the stream. A reportable result occurs if a measured analyte concentration in groundwater exceeds a Tier II action level and the background M2SD value. If there have not been historic reportable results, or the recent concentration exceeds the historic M2SD concentration in the well, the required action is to initiate monthly sampling. Under monthly sampling, if action levels are exceeded for three consecutive months, then stakeholders are notified via a subsequent Quarterly RFCA Groundwater Monitoring Report, and the possible impacts to surface water are evaluated in the Annual RFCA Groundwater Monitoring Report. Boundary wells are identified by the well class letter "B" in tables in this report.

2.2.5 D&D Monitoring Wells

These wells monitor for releases to groundwater from D&D activities. Baselines will be established for D&D groundwater monitoring locations during writing of the 2003 Annual RFCA Groundwater Monitoring Report. Criteria have not yet been established for classifying D&D groundwater concentrations as non-reportable, or reportable, except for Building 886.

A reportable result would occur when a measured concentration downgradient of the building(s) exceeds the M2SD of the established baseline concentration. Given a reportable result, the required action is to inform appropriate parties and initiate an evaluation of the situation. D&D groundwater data are evaluated in the Annual RFCA Groundwater Monitoring Reports. However, any constituents that exceed RFCA action levels in D&D groundwater wells are tabulated in the Quarterly RFCA Groundwater Monitoring Reports. D&D monitoring wells are identified by the well class symbol "DD" in tables in this report.

2.2.6 Performance Monitoring Wells

These wells monitor the effect of a remediation or source removal action, as required in the ALF. If an increasing trend in the concentration of a contaminant is noted, then the appropriate parties are notified and an evaluation of the situation is initiated. Groundwater concentration trends are evaluated in the Annual RFCA Groundwater Monitoring Reports. However, any constituents that exceed RFCA action levels in Performance Monitoring wells are tabulated in the Quarterly RFCA Groundwater Monitoring Reports. These wells are identified by the well class symbol "PM" in tables in this report.

2.2.7 RCRA Monitoring Wells

RCRA wells monitor water quality upgradient and downgradient of a RCRA unit. If the mean concentration of a contaminant in a downgradient well exceeds the mean concentration in upgradient wells at statistically significant levels, and the downgradient concentration at the well shows a statistically significant upward trend with time, a report will be made to appropriate agencies and an investigation will be initiated to determine possible causes. A RCRA evaluation will be performed in the Annual RFCA Groundwater Monitoring Report.

The quarterly RFCA monitoring reports treat analytical results from RCRA wells in the same manner as Drainage Wells. A reportable result for a RCRA well occurs if a measured concentration exceeds a Tier II action level and the background M2SD value. When there have not been historic reportable results, or a value exceeds the historic M2SD concentration in the well when there have been historic reportable results of Tier II action levels, the required action is to initiate monthly sampling. If action levels are exceeded for three consecutive months, by the above criteria, then RFETS stakeholders are notified in a

subsequent Quarterly RFCA Groundwater Monitoring Report. RCRA monitoring wells are identified by "R" in tables of this report.

2.2.8 Plume Degradation and Other Monitoring Wells

Plume Degradation wells are assumed to contain contaminated groundwater and are used to assess if natural geochemical processes are an effective alternative to groundwater remediation. Degradation data are reviewed in the Annual RFCA Groundwater Monitoring Reports to determine if sufficient data have been collected to support remedial decision making. Although these wells do not have reportable results as defined by the IMPBD, any constituents that exceed RFCA action levels in Plume Degradation wells are tabulated in the Quarterly RFCA Groundwater Monitoring Report. Plume Degradation wells are identified by the well class symbol "PA" in this report.

Numerous wells exist at RFETS that are not regularly monitored as a part of the IMP-driven Groundwater Monitoring Program. On an as-needed basis, groundwater may be sampled from some of these "Non-IMP" wells to satisfy specific project-driven data quality objectives. Non-IMP wells are identified by the well class symbol "N" in tables of this report.

The Well Abandonment Program (WARP) at RFETS often collects a final groundwater quality sample prior to abandoning a well. This is generally done if no recent data are available from a well. Groundwater quality samples collected by WARP are designated as well class "A" in tables of this report.

3 WATER QUALITY RESULTS

Groundwater Monitoring Program personnel at RFETS attempted to collect water quality samples from 23 wells, building drains, and sumps during 1Q2004. This work was performed as prescribed in the IMP (DOE, 2003a and 2003b). The monitoring program currently includes 177 IMP wells. Additional non-IMP wells are included in 1Q2004 monitoring. Tables 3-1 and 3-2 list the IMP groundwater monitoring locations visited and indicate sampling success or failure by analyte suite.

During the quarter, a total of 13 sampling locations produced sufficient groundwater for collection of either the full requested sample suite, or a partial sample suite. However, 5 locations remained completely dry during the quarter. Most dry locations were visited several times in attempts to collect the required water samples. Tables 3-1 and 3-2 list the wells sampled and the analytes or analytical suites analyzed during 1Q2004.

The overall size of the dataset for 1Q2004 was 2,563 analytical records (including laboratory QA/QC). This is fewer than the 16,692 data records of the previous quarter.

Figures 3-1 and 3-2 show the distribution of groundwater sampling locations visited at RFETS during the first quarter, in relation to nitrate and composite VOC plume boundaries (from the 2001 Annual RFCA Groundwater Monitoring Report). Figure 3-1 covers a larger area including the boundary wells along Indiana Street. Figure 3-2 is an enlargement of the central plant area. These figures show the well locations in terms of 6 color-coded categories, as follows.

- Wells that were dry during the quarter, permitting no sampling (black open circles).
- Wells from which groundwater was sampled, and all analytes in the water were less than Tier II action levels (green-filled circles).
- Wells for which one or more groundwater analyte concentrations was >Tier II, but none were reportable (yellow-filled circles).
- Wells in which one or more groundwater analytes triggered a reportable Tier II event (yellow-filled squares).
- Wells for which one or more groundwater analyte concentrations was >Tier I, but none were reportable (red-filled circles).
- Wells in which one or more groundwater analytes triggered a reportable Tier I event (red-filled squares).

The following text sections discuss analyte concentrations greater than Tier II action levels (Table 3-3); reportable Tier II events (Table 3-4); analyte concentrations greater than Tier I action levels (Table 3-5); and reportable Tier I events (Table 3-6).

3.1 Groundwater Analyte Concentrations Greater Than Tier II

Table 3-3 presents analytical data for 34 "Tier II events" in which measured chemical concentrations (or activities) in groundwater samples were greater than the corresponding RFCA Tier II action levels (or PQLs). Groundwater in 7 different wells or drains contained one or more of these Tier II events. Groundwater from RCRA wells accounted for 16 (or 47%) of the 34 events listed in Table 3-3. The numbers of Tier II events in other well classes are as follows: Plume Extent (8), Plume Definition (6), and Performance Monitoring (4).

The most frequently observed analytes in the 34 Tier II events (Table 3-3) are U-233/234 (5 events), U-235 (5 events), U-238 (4 events), selenium (4 events), and nitrate/nitrite (4 events).

The database equivalent of Table 3-3 may be used to evaluate reportable and non-reportable results through examination of the Tier II, background, and historic ratios described earlier. Tier II, background, and historic ratios may also be used to help select analytes and wells which are of interest for Site remediation, but which may not be reportable under IMP criteria.

3.2 Tier II Reportable Results

Table 3-4 lists 16 reportable Tier II events that have been identified from examination of IQ2004 groundwater quality data. Note that this table is somewhat redundant because it includes not only target analyses, but some lab duplicate analysis records. These Tier II events do not include the Tier I events discussed later in Sections 3.3 and 3.4. Groundwater from 3 wells or drains contained one or more of these reportable events.

Eleven of the 16 reportable Tier II results were in groundwater from RCRA wells 70393 and B206989, while 5 were from Plume Extent Well 1786.

Plume Extent wells are located at the edges of known contaminant plumes in RFETS groundwater, therefore, constituents that exceed Tier II action levels are expected to occur in these wells. The most notable result may be groundwater from Well 1786 which had a nitrate/nitrite concentration of 504 MG/L during January 2004. Well 1786 is located near the discharge gallery below the nitrate and uranium plume leaving the former solar evaporation ponds (SEP) area.

RCRA Well B206989 is located downgradient (east) of the Present Landfill and East Landfill Pond. Groundwater from this well contained reportable concentrations of nitrate/nitrite, Li, Se, sulfate, and U-235. The sulfate concentration was 2,880 mg/L on 1/15/04.

Time series plots (starting with Figure 3-3) are found at the end of Section 3 for the Tier II reportable events tabulated in Table 3-4. Each plot shows how the concentration of a specific analyte varied throughout the water sampling history of a monitoring well. A trend plot is not presented if there are fewer than three data points from which to establish a concentration trend for the analyte.

3.3 Groundwater Analyte Concentrations Greater Than Tier I

Table 3-5 lists data for 4 "Tier I events" in which 1Q2004 groundwater analyte concentrations (or activities) were found to be greater than the corresponding Tier I action levels. Actually only two of these are events associated with the primary sample, and the other two are for laboratory duplicate analyses. Groundwater collected from Performance Monitoring Well 70099 contained these Tier I events during water sampling on 2/18/04.

The Tier I events are for uranium isotopes U-238 and U-233,-234 associated with the SEP nitrate and uranium plume at Well 70099. This well is located north of SEP Pond 207A.

3.4 Tier I Reportable Results

During 1Q2004, there were no reportable Tier I groundwater events. When there are reportable events, and if at least three data points are available, the historical concentrations of Tier I reportable analytes in RFETS groundwater are plotted. These are included with the Tier II trend charts which begin at Figure 3-3.

4 REQUIRED ACTIONS

Planned monitoring actions arising from the current evaluations of 1Q2004 groundwater data are discussed below. These proposed actions are followed by a brief summary of monitoring actions initiated by prior Quarterly RFCA Groundwater Monitoring Reports. Because of the time lag between the collection of data that later triggers monthly sampling, and the actual completion of that sampling, it is often necessary to include and discuss groundwater data collected outside 1Q2004.

4.1 Planned Monthly Monitoring Based on 1Q2004 Data

Table 4-1 lists no wells, which have been identified as potential candidates for monthly sampling (for three months) based on the results of the 1Q2004 sampling event. This is the first time in recent years that no wells have been identified for monthly sampling.

4.2 Monthly Monitoring Initiated by the Previous Quarterly Report

The 4Q2003 RFCA Monitoring Report (URS, 2004) initiated monthly sampling for the analytes and wells listed below. Although the IMP calls for monthly sampling for three events, many wells at RFETS are seasonally dry or produce limited sample volumes. Therefore, three monthly samples are often unavailable.

- Chloroform in groundwater of Well 20902.
- TCE in groundwater of Well 21498.
- PCE in groundwater of Well P416689.

Because the current 1Q2004 report is being generated within a few days of the 4Q2003 report, there has been no time to implement the monthly sampling required by the 4Q2003 report. Therefore, there are no data to discuss in this section. The results of monthly sampling initiated by evaluations included in the 4Q2003 report will be discussed in the 2Q2004 report during August 2004. There are no monthly samples initiated by evaluations in this 1Q2004 report.

Table 4-1. Candidate Wells and Analytes for Monthly Sampling and Analysis.

Location	Sample Date	Sample Number	Analyte	QC Code	Result Type	Result	Error	Units	Result Qualifier	Validation	Detection Limit	Dilution	Filtered	Tier II	Background	Historic M2SD	Monthlies	Well Class	Other Class
No wells were identified for monthly sampling and analysis during 1 st Quarter 2004																			

5 VALIDATION AND DATA QUALITY ASSESSMENT

The following text helps the reader distinguish between the "data validation" or "data verification" performed by ASD, and the "data quality assessment" (DQA) performed by WMCP personnel at RFETS. Also discussed are the technical basis, equations, and criteria used for the groundwater DQA.

5.1 General Discussion

Data validation and verification (V&V) procedures are the principal means of assessing the usability of groundwater analytical data. V&V also improves overall data quality by allowing ASD to closely monitor laboratory performance and to provide feedback to each laboratory regarding its ability to produce quality data that meets subcontract requirements. Information from V&V enables ASD to direct analytical work to laboratories that demonstrate superior performance by generating timely, high quality analytical data for RFETS.

Data validation is a rigorous data review performed by a Kaiser-Hill ASD subcontractor on approximately 25% of the groundwater analytical data generated by RFETS. The remaining 75% of the data are verified under less extensive data reviews than the validated data are subjected to. Verification-validation criteria are generally based on government-published standards and guidelines, primarily EPA Contract Laboratory Procedures (CLP) and SW-846 method guidelines for organic and inorganic data evaluation and review. Validation and verification are technically specialized data evaluations and are usually performed by analytical chemists. V&V work for RFETS is performed in accordance with a set of ASD procedures, some of which are listed below.

- K-H, 2002, General Guidelines for Data Verification and Validation, DA-GR01-v2, 10/1/02.
- K-H, 2002, Verification and Validation Guidelines for Volatile Organics, DA-SS01-v3, 10/1/02.
- K-H, 2002, Verification and Validation Guidelines for Inorganic Metals, DA-SS05-v3, 10/1/02.
- K-H, 2002, Verification and Validation Guidelines for Radionuclides by Gamma Spectrometry, DA-GAM-v1, 6/4/02.

All groundwater analytical data collected by RFETS are considered valid (V or V1) unless the V&V process identifies analytical problems that require the data to be qualified. When it is necessary to qualify individual data records, standard qualifier codes (alphanumeric validation codes) are applied. Integer "reason codes" often accompany these validation codes, enabling the data user to determine why the results were qualified. For example, groundwater data with a validation qualifier "R1" and a reason code

“101”, indicates that the verification process rejected the data as unusable for reason 101 (sample holding times were exceeded).

Common data qualifiers are defined below. Please refer to ASD documents for a complete list and for formal definitions.

- V Valid data. Validation found no problems with the results.
- V1 Valid data. Verification found no problems with the results.
- 1 This is a common but erroneous code found in the SWD validation field. Further checking by ASD usually confirms that the corresponding data record has been validated and should be V1.
- J The analytical result is estimated.
- U The analytical result is considered not detected (nondetect).
- JB Result is <RDL and estimated due to blank contamination.
- NJ The result is presumptively estimated.
- UJ Indicates an estimated nondetect result.
- R Unusable data, rejected by validation.
- R1 Unusable data, rejected by verification.

V&V work focuses on evaluation of laboratory quality control data such as method blanks, laboratory control samples (LCS), and spike recoveries. It also checks for adherence to sample and extract holding times, standard analytical methods, contractual requirements, and proper documentation.

Although DQA and V&V examine some of the same quality control data, they do so from different perspectives. DQA (in this report) looks at the overall quality of an entire calendar quarter of groundwater data, in contrast to V&V, which looks at the analytical details of individual data packages. V&V focuses on laboratory methodology, while DQA focuses on interpretation of data describing QC samples that originated in the field, such as “field duplicate” samples and “equipment rinsate” samples.

In contrast to V&V, the data quality assessment performed by WMCP personnel at RFETS, does not assign data qualifiers to individual analytical results or data packages. DQA is a second level of quality assurance intended to be a general assessment of how well the groundwater data collection program is operating. The DQA is performed by evaluating water quality data in terms of the PARCC parameters.

5.2 PARCC Parameters

Use of the PARCC parameters for DQA has been promoted by EPA guidance documents. These parameters include: precision, accuracy, representativeness, completeness, and comparability. Accuracy and precision are quantitative measures. Representativeness and comparability are qualitative measures. Completeness is a combination of both quantitative and qualitative measures.

WMCP personnel evaluate the PARCC parameters by following guidelines published in the following QC documents.

- RMRS, 2001, Quality Assurance Program Plan For The Groundwater Monitoring Program Rocky Flats Environmental Technology Site" (the QAPP).
- RMRS, 1998, Procedure for Evaluation of Data For Usability.

The following paragraphs discuss the PARCC parameters in detail and discuss the types of data available to assess them.

5.2.1 Criteria for Precision

The precision of a measurement is an expression of the mutual agreement between duplicate measurements of the same property taken under similar conditions. Precision can be expressed quantitatively by the relative percent difference (RPD) between real and field duplicate samples for Metals, Volatile Organic Compounds, Polychlorinated Biphenyls and Water Quality Parameters as defined by the following equation:

$$RPD = \frac{|(S - D)|}{(S + D)/2} * 100$$

where: S = Concentration of analyte in Real Sample

D = Concentration of analyte in Duplicate Sample

The RFETS WMCP uses the Duplicate Error Ratio (DER) to quantify the precision of radionuclide activity data.

$$DER = \frac{|(S - D)|}{\sqrt{[(TPU_s)^2 + (TPU_d)^2]}}$$

where: TPU_S = Total Propagated Uncertainty of the Sample

TPU_D = Total Propagated Uncertainty of the Duplicate

S = Sample Result

D = Duplicate (or Lab Replicate) Result

Because TPU is seldom reported with radionuclide activity data, the two-sigma error or random counting error has been substituted for TPU in the Uranium, Americium/Plutonium and Strontium calculations made for this report.

The RFETS QC criterion for groundwater RPDs is that individual RPDs should be $\leq 30\%$. The analogous criterion for DERs is to be ≤ 1.96 . The overall goal for the quarterly groundwater dataset is to have 85% of the RPD and DER values comply with the QC criteria.

5.2.2 Criteria for Accuracy

Accuracy is the degree of agreement for a measurement with an accepted reference or true value, and is a measure of the bias in a system. The closer the measurement to the true value, the more accurate the measurement. RFETS V&V process (described earlier) is the principal means for evaluating the accuracy of analytical results.

Accuracy assessment for PARCC evaluations, is based on the Procedure for Evaluation of Data For Usability (RMRS, 1998). Because the RFETS V&V process compares the actual analytical methods used by each laboratory to the contract-required analytical methods, the WMCP does not repeat this. However, the DQA does use a database query to compare the contract-required detection limits (CRDLs) for each analyte to the achieved detection limits.

Matrix spike and matrix spike duplicate recoveries are reported by the analytical laboratories for most non-radionuclide analytical suites. Criteria for acceptable matrix spike recoveries vary between laboratories, depending on the analyte, and the analytical method. The criterion for acceptable matrix spike results ranges from 75 to 125 % recovery.

Laboratory control sample (LCS) recoveries for radionuclides are often available for groundwater quality data. According to KH-ASD, laboratories in practice will commonly accept LCS values in the range of 70-130 %. LCS percent recoveries between the 70-130 % laboratory range and the 75-125 % QC range required by the KH-ASD laboratory contracts are examined by data validators for acceptability on an analyte by analyte basis. The criterion for acceptable LCS recoveries ranges from 75 to 125 % recovery.

Because some laboratories reported LCS results in pCi/L, while others calculated % recovery, the ASD-KH team implemented a new reporting criterion, "relative bias". The relative bias criterion is defined in the BOA by the following formula (see Page J-6 of the National BOA, section 2.3.2.5):

$$\text{RelativeBias} = \frac{\text{Observed} - \text{Known}}{\text{Known}}$$

where: Observed = measured activity of LCS standard (pCi/L)

Known = known activity of LCS standard (pCi/L)

Acceptable values for relative bias results range from -0.25 to +0.25. ASD-KH requested that laboratories begin reporting relative bias calculations for LCS samples in November 2001, and actual reporting began during the first quarter of 2002.

5.2.3 Criteria for Representativeness

Representativeness in DQA is limited to an evaluation of whether analytical results for field samples are truly representative of environmental concentrations, or whether they may have been influenced by the introduction of contamination during collection and handling. The potential introduction of contamination is evaluated by examination of the analytical results for equipment rinsates.

Equipment rinsates are used to assess the efficacy of the decontamination process used to clean groundwater sampling equipment. Analytes detected in rinsate samples indicate possible cross-contamination between environmental samples. Rinsates are samples of volatile-free "distilled" water that have been poured over or through decontaminated sampling equipment and subsequently handled in the same manner as environmental samples.

Although rinsates are used specifically as indicators of cross-contamination from improper decontamination of equipment, they are carried through the entire sampling, shipping, and laboratory process. Therefore, they are good indicators of potential contamination introduced during any of these steps. Because rinsate samples are judged adequate to assess introduced contamination, the WMCP does not use "trip blanks" in its QA program.

Other aspects of representativeness, such as the number of samples and their spatial distribution, are fixed by the FY 2002 Integrated Monitoring Plan (DOE, 2002). The DQA checks if all wells required to be sampled by the IMP, were visited during the quarter.

5.2.4 Criteria for Completeness

A qualitative measure of completeness is the rate of successful sampling. In each quarter the DQA verifies if all samples specified in the IMP were collected, unless a well was dry, or went dry during sampling. The completeness goal for successful sampling is the collection of at least 90% of the planned samples. However, the frequency of dry wells is outside the control of the WMCP. If all required wells were visited (some more than once), sampling completeness is considered acceptable.

Completeness as a quantitative measure of data quality may be expressed as the percentage of valid or acceptable data obtained from a measurement system. K-H ASD tracks analytical laboratory performance and both the shipment of samples to the laboratory and the receipt of data from the laboratory. Therefore, the WMCP does not track the timeliness of data receipt from the laboratories, but evaluates data completeness on the following formula:

$$\text{Completeness} = DP_u = \frac{DP_t - DP_n}{DP_t} * 100$$

where: DP_u = Percentage of usable data points

DP_t = Total number of data points

DP_n = Non-usable (rejected) data points

The completeness criterion is having $\geq 90\%$ valid samples.

5.2.5 Criteria for Comparability

Comparability is a qualitative parameter. Consistency in the acquisition, handling, and analysis of samples is necessary for comparing results. Data developed under the WMCP are collected in accordance with RFETS SOPs, transported per RFETS SOPs and US-DOT shipping regulations, and analyzed using standard EPA, or nationally recognized analytical methods. This helps to ensure comparability of results with other analyses performed in a similar manner.

At the start of third quarter 2001, nomenclature changed for the test method for metal analyses. However, this change in nomenclature does not affect the comparability of recent results with earlier analyses. K-H ASD verifies that laboratory analyses are performed according to the standard protocols specified by the RFETS subcontract to each laboratory. Therefore, the analytical results should be comparable to data produced by similar methods.

At the start of the second quarter 2001, the technique for the analysis of Volatile Organic Compounds was changed from the EPA 524.2 Drinking Water to the EPA SW-846, 8260 (Low Level) method. The change was made because the SW-846 method requires (as EPA 524.2 does not) a pre-screening analytical run that should help laboratories determine appropriate levels of dilution, when needed. The list of analytes for SW-846 includes all analytes in the EPA 524.2 list with the addition of (detection limits in ug/l given in parentheses) 1,1,2-trichloro-1,2,2-trifluoroethane (1), acetone (10), carbon disulfide (1), 2-butanone (10), 2-hexanone (10), and 4-methyl-2-pentanone (10). Detection limits for all remaining compounds are unchanged (at 1 ug/l) including the RFETS contaminants of concern (vinyl chloride, 1,1-dichloroethene, methylene chloride, carbon tetrachloride, cis-1,2-dichloroethene, chloroform, 1,1,1-trichloroethane, trichloroethene and tetrachloroethene). Because both the EPA 524.2 and SW-846 methods use gas chromatography as the basic analytical method, and detection limits have not changed, results gathered using either method should be comparable.

In the fourth quarter of 1998, the groundwater sampling procedure was modified to enhance the quality of the samples collected, and reduce the amount of purge water generated at certain wells. This practice has continued to the present. Dedicated bladder pumps were installed in some wells with adequate recharge rates. Pump equipped wells provide an opportunity for "micropurging" at the time of sampling.

Micropurging has several advantages over traditional groundwater sampling methods. Micropurge sample collection provides a method of minimizing increased colloid mobilization by removing water from the well in the screened interval at a rate that minimally disrupts steady-state flow conditions in the aquifer. During micropurge sampling, groundwater is discharged from the aquifer at a rate that minimizes drawdown at the well. Research indicates that colloid mobilization usually does not increase above steady-state conditions during low-flow discharge. Therefore, the collected sample is more likely to represent *in situ* groundwater chemistry. Because less water is needed to purge the pump system compared to purging the entire well with a bailer, there is less purge water to dispose of.

The installation of bladder pumps and micropurging without sample filtration resulted in a change in analytical method for metals. Pump equipped wells are sampled and analyzed for total metals because no filter is used during sample collection. Groundwater samples from bailed wells are filtered and analyzed for dissolved metals.

5.3 Groundwater DQA Results 1Q2004

Data used to evaluate the PARCC parameters are included in the 1Q2004 dataset described in Section 3.

5.3.1 Precision During the Quarter

Duplicate error ratios (DER) are indicators of precision for radionuclide analyses (see 5.2.1). The QC criterion for precision requires that individual DER values should be ≤ 1.96 , and overall the dataset should have $\geq 85\%$ compliance with the criterion. Table 5-1 is a tabulation of the DER values for 1Q2004 radionuclide analyses. The table has been sorted by the DER parameter so that the range of values is apparent. The DER range is from 0.66 to 0.96 indicating that no records exceeded the 1.96 criterion. Overall, 100% of the DER data are in compliance with the criterion, indicating excellent precision for radionuclide analyses.

Relative percent difference (RPD) between real and field duplicate sample results is an indicator of precision for non-radionuclide analyses. Individual RPD values should be $\leq 30\%$ and at least 85% of the RPDs should comply with the criterion. Table 5-2 tabulates RPD values and is sorted first by analyte suite, then by RPD, in order to highlight the RPD range of each suite. RPD values for metals ranged from 0% to 44.6%; VOCs had RPDs of 0%; and RPDs for Water Quality Parameters varied from 0.9% to 1.6%.

Table 5-3 summarizes the RPD findings of Table 5-2 and determines if the 85% goal has been met. During 1Q2004, the RPD goal was met for water quality parameters (100%), and for VOCs (100%). Metals also met the RPD goal with 89% acceptable RPDs. Overall, these non-radionuclide data had 96.8% acceptable RPDs, and met the 85% goal.

5.3.2 Accuracy During the Quarter

Detection limits achieved by the laboratories analyzing samples collected during 1Q2004, were compared with the contract-required-detection limits (CRDLs) as an indicator of accuracy. An analytical reporting limit is raised by the dilution factor when sample dilution is necessary to bring an analyte within an analytical instrument's calibration range. Such dilution is required under laboratory subcontracts issued by RFETS. Therefore, the DQA analysis normalized reporting limits (RDLs) by dividing each of them by the sample dilution factor prior to comparing them against the CRDLs.

A database query compared each normalized RDL to the corresponding CRDL and found no RDLs that exceeded their CRDLs (Table 5-4). This is better performance than the last quarter, when 11 analyses of petroleum hydrocarbons exceeded their CRDLs. The most significant observation is that 100% of the 1,257 data records (for REALs, DUPs, RNSs) achieved the contract-required CRDLs. Thus, by this measure the groundwater data are of high accuracy.

Matrix spike recoveries provide another measure of accuracy. Table 5-5 displays recoveries for 290 matrix spikes (MS) and matrix spike duplicate (MSD) samples for metals, VOAs, and water quality

parameters (WQP includes major and minor anions). This large amount of data is summarized in Table 5-6. The VOCs and water quality parameters, met the QC goal by having more than 90% of their recoveries fall in the range 75% to 125%. WQPs and VOCs had 100% of their spike recoveries fall in the acceptable range. The metals suite missed the goal with 79% acceptable recoveries. Overall, across all analytical suites, the percentage of acceptable MS/MSD results was 86%, failing the accuracy goal of 90%.

Relative bias values for Laboratory Control Samples (LCS) are used to evaluate the accuracy of radionuclide analyses, instead of matrix spikes. Table 5-7 is a tabulation of relative bias values for radionuclide analyses generated during 1Q2004. There are only 3 records, but the table is sorted by relative bias to show its range. The QC criterion for the acceptable range of relative bias values is from -0.25 to +0.25. Note that 100% of the relative bias values for radionuclide LCS samples are in the acceptable range. Thus the groundwater radiochemistry data appear to be of high accuracy.

LCSs results for non-radionuclide suites were available for metals, VOAs, and water quality parameters (including anions). These LCS recoveries are tabulated in Table 5-8, which is sorted by analyte group, analytical method (LIC), then by % recovery. The LCS recoveries for metals fell in the range 91% to 117% and 100% of the metals recoveries were within the 75% to 125% acceptable QC range. Similarly water quality parameter recoveries ranged from 94% to 109% and were all acceptable. All but 2 of the VOA recoveries were acceptable, ranging from 69% to 115%. There were no SVOA or PCB data this quarter. In summary the LCS recoveries indicate that 1Q2004 groundwater analytical data for metals, VOAs, and water quality parameters are all of high accuracy.

Another aspect of accuracy is "rejected data". Out of 1,257 analytical records representing reals, duplicates and rinsates during 1Q2004, no records were rejected (R1 qualified) during data verification, or validation. Another way to state this is that 100% of the analytical data collected during the first quarter were considered to be valid and usable. Table 5-9 is included to maintain the table numbering although this table does not list any rejected records this quarter.

5.3.3 Representativeness During the Quarter

As written earlier, representativeness is an evaluation of the sampling procedure for its ability to reflect the true groundwater concentrations of contaminants. Equipment rinsate samples are used by the WMCP to determine whether there is introduced contamination from improper or incomplete decontamination of the sampling equipment.

During 1Q2004 a total of 98 rinsate analytical records were generated for VOAs, metals, radionuclides, and water quality parameters. Most of these records lack evidence of contamination. Two records at the top of Table 5-10 provide relatively weak evidence of contamination, potentially due to incomplete

decontamination of sampling equipment. Both of these records are associated with sampling at Well 70193 on 1/13/04. The RNS sample showed Cu at 5.9 ug/L and U-233,-234 at 1 pCi/L. These results are both less than Tier II action levels.

Overall, little contamination was introduced during 1Q2004 groundwater sampling and/or shipping activities. Therefore, groundwater quality data for the first quarter are judged to be representative of the actual well water concentrations.

Because all required sampling locations defined in the IMP were visited (Table 5-11 discussed below), and almost all samples that could be collected were analyzed, analyses for the first quarter 2004 are judged to be representative with respect to spatial coverage.

5.3.4 Completeness During the Quarter

Table 5-11 indicates that during first quarter sampling crews made 29 visits to wells or drains, in attempts to collect groundwater samples. In fact, multiple visits were made to many dry wells and to wells with insufficient water for collection of all requested samples.

Dry wells and wells with insufficient groundwater prevented collected of all requested samples. Table 5-11 shows that only 57% of U-isotope samples were collected. However, the sampling success rates for all other requested suites fell between 62% and 100%. Overall the sampling success rate (for all analyte suites) was 73% during 1Q2004. The goal, groundwater conditions permitting, is to have greater than or equal to 90% successful sampling. However, because availability of groundwater is beyond the control of the samplers, and because all requested well visits were performed, sampling completeness is considered adequate for 1Q2004.

Validation/Verification completeness is summarized in Table 5-12. This table compiles by analytical suite (actually SWD line item code), the total number of data points for reals, duplicates, and rinsate samples. It then subtracts rejected data points, and subtracts points that lack validation qualifiers. The result is the net number of usable validated or verified data points, and this is expressed as % usable data, or % V&V completeness. The QC goal for completeness is $\geq 90\%$.

This quarter metals, VOCs, radionuclides, and water quality parameters all met the completeness goal. The overall validation completeness across all analytical suites was 97.5% meeting the completeness goal. Therefore, from the perspective of V&V completeness, the 1Q2004 groundwater data are acceptable.

Another measure of completeness is that an adequate number of QC samples (field duplicates and equipment rinsates) must be collected to meet QC requirements. The recommended frequency for

collecting duplicate samples is 1 duplicate (DUP) per 20 or fewer primary (REAL) water samples. In other words, duplicates should be collected at a 5 % or greater frequency per REAL sample. Like duplicates, rinsate samples (RNS) are also to be collected at a 5% or greater rate.

The sample collection frequencies of REAL, DUP, and RNS samples are tabulated by analyte suite in Table 5-13. The ratios of REAL/ DUP samples shown in Table 5-13 all meet groundwater QC goals with one DUP per 8 or fewer REALs. Overall there was one DUP per 6.2 REALs. Across all analyte suites and samples collected during the quarter, the overall frequency of duplicates was 16%, exceeding program goals of 5%. If the data in SWD are examined on a per record basis, the frequency of duplicates is of similar magnitude at 9%.

The ratios of REAL/ RNS samples of Table 5-13 meet program QC goals with one rinsate per 8 or fewer REALs. Overall, across all suites and samples collected during the quarter, the rinsate collection frequency was 16%, exceeding program goals of 5%. On a per record basis the frequency of rinsates was 9%.

In summary, both field duplicate and rinsate sampling frequencies were within QC requirements on both a per sample and a per record basis, for metals, VOAs, WQPs, and radionuclides.

5.3.5 Comparability During the Quarter

No program-wide changes were made to groundwater sampling or to analytical procedures in the first quarter of 2004. Therefore, the analytical data generated during 1Q2004 should be comparable to corresponding analyses from previous quarters.

5.4 Quarterly DQA Summary

The above DQA evaluations of groundwater quality data for 1Q2004 lead to the following conclusions, listed by PARCC parameter.

Precision

- Overall, 100% of the DER values meet the criterion, indicating excellent precision for radionuclide analyses.
- Overall, the non-radionuclide data had 96.8% acceptable RPDs, and met the 85% goal. This is an improvement from the prior quarter, when data failed to meet the goal.

Accuracy

- The most significant observation is that 100% of the data records achieved the contract-required CRDLs during 1Q2004. By this measure the groundwater data are of high accuracy.
- Out of 1257 analytical records representing reals, duplicates and rinsates during 1Q2004, no records were rejected (R1 qualified) during data verification or validation. Another way to state this is that 100% of the analytical data collected during the quarter were considered to be valid and usable.
- Overall, across all analytical suites, the percentage of acceptable MS/MSD results was 86%, not meeting the accuracy goal of 90%. This is down from last quarter, which had 91% acceptable results.
- Note that 100% of the relative bias values for radionuclide LCS samples are in the acceptable range. Thus the radiochemistry data also appear to be of high accuracy. High percentages of LCS recoveries in the acceptable range indicate that 1Q2004 groundwater analytical data for metals, VOAs, and water quality parameters are all of high accuracy.

Representativeness

- Overall, little contamination was introduced during 1Q2004 groundwater sampling and/or shipping activities, because only two of the rinsates appear to be contaminated, and the remaining records are mostly "B" or "J" qualified. Therefore, in general groundwater quality data for the first quarter are judged to be representative of the actual well water concentrations.

Completeness

- The overall sampling success rate (for all analyte suites) was 73%. Although this is below the goal of 90%, the availability of groundwater is beyond the control of the samplers. Because all requested wells were visited, sampling completeness is considered adequate for 1Q2004.
- The overall validation completeness across all analytical suites was 97.5% exceeding the completeness goal, and similar to the completeness of last quarter. Therefore, from the perspective of V&V completeness the 1Q2004 groundwater data are acceptable.
- In summary, both field duplicate and rinsate sampling frequencies met QC requirements on both a per sample and a per record basis.

Comparability

- No program-wide changes were made to groundwater sampling or to analytical procedures in the first quarter of 2004. Therefore, the analytical data generated during the quarter should be comparable to previous quarters.

Table 5-3. Summary of Relative Percent Differences (RPD) Values.

Analyte Group	Total Number of RPD Results	Number of Unacceptable Results RPD>30%	Number of Acceptable Results	Percentage Acceptable	Goal Met
Metal	28	3	25	89.29	Yes
VOC	64	0	64	100.00	Yes
WQP	3	0	3	100.00	Yes
Totals	95	3	92	96.84	Yes (overall)
Table Note: Radionuclides are evaluated by DER rather than RPD results.					

Table 5-4. Reporting Limits Greater Than Contract Required Detection Limits.

Location	Sample Date	Sample Number	Analyte	QC Code	Result Type	Std Result	Error	Std Unit	Result Qualifier	Validation	Std DetLimit	Dilution	Normalized RL	CRDL	Filtered	Lab	LIC	Method
No samples had reporting limits greater than the contract required detection limits.

THIS PAGE INTENTIONALLY LEFT BLANK.

Table 5-6. Summary of MS & MSD Recovery Data.

Analyte Group	Total Number of MS & MSD Results	Number of Low Results Below	Number of High Results Above 125%	Number Acceptable	Percentage Acceptable	Goal Met
Metal	196	24	17	155	79.08	No
VOC	88	0	0	88	100	Yes
WQP	6	0	0	6	100	Yes
	Total Results	Total Low	Total High	Total Acceptable	Total % Acceptable	Goal Met
Totals	290	24	17	249	85.86	No (overall)

Table Notes:

MS is matrix spike and MSD is matrix spike duplicate sample.

VOC indicates volatile organic compounds.

WQP indicates water quality parameters.

Relative bias values are used instead of matrix spikes for evaluating radionuclide accuracy.

Table 5-7. Lab Control Sample (LCS) Data for Radionuclides.

Result Type	Lab	Lab Batch	Lab Sample Number	Analyte	Result	Units	Error	Relative Bias	RIN
LC1	GEL	304553	1200557206	URANIUM-238	57.9	PCI/L	9.04	-0.0676	04D0329
LC1	GEL	313696	1200578854	URANIUM-238	12.2	PCI/L	2.25	-0.0161	04D0391
LC1	GEL	303794	1200555558	URANIUM-238	61.3	PCI/L	9.22	0.005	04D0324

Table 5-11. Comparison of Required versus Collected Groundwater Samples.

Sample Types	Required Number of Visits	Actual Number of Visits*	Deviation	Success Ratio % Samples Collected or Wells Visited	Discrepancy Justification
Groundwater Wells (Visits)	29	29	0	100.0	
Volatile Organic Compounds	19	16	3	84.2	Dry or Insw
Dissolved Gasses (Methane/Ethane/Ethene)					
Metals	14	10	4	71.4	Dry or Insw
PCBs					
Radionuclides					
Pu/Am					
U-isotope	14	8	6	57.1	Dry or Insw
Cesium-137					
Strontium-89/90					
Water Quality Parameters					
Alkalinity					
Chloride					
Cyanide					
Fluoride	8	5	3	62.5	Dry or Insw
Nitrate or Nitrite (sole)					
Nitrate/Nitrite	11	7	4	63.6	Dry or Insw
Dissolved Silica					
Orthophosphate					
Sulfate	8	5	3	62.5	Dry or Insw
Sulfide as H ₂ S					
Total Dissolved Solids					
Total Organic Carbon					
Petroleum Hydrocarbons, T. Rec.	11	11	0	100.0	
Totals	85	62	23	72.9	Dry or Insw

Table Notes:

*Includes monthly, duplicate and rinsate samples.

Dry = Well did not recharge after purging. No samples collected.

Insw = Insufficient water to complete sample suite.

Table 5-12. Summary of Validation and Verification Data Completeness.

Chemical Group	Analytical Method	Total Number of Data Values	Number of Unvalidated Data Values	Number Rejected	Net Usable Data Values	Completeness	Goal Met
Metal	EPA 600	420	28	0	392	93.33	Yes
